1 Self-gravitating thin disk with bulb

Consider a self gravitating disk with surface density Σ and gravitational potential Φ. Let $\boldsymbol{v}$ be its velocity field and P its pression field. Then it is described by the system

$$\frac{\partial \Sigma}{\partial t} + \boldsymbol{\nabla} \cdot (\Sigma \boldsymbol{v}) = 0, \tag{1}$$

$$\frac{\partial \boldsymbol{v}}{\partial t} + (\boldsymbol{v} \cdot \boldsymbol{\nabla})(\boldsymbol{v}) = -\frac{1}{\Sigma}\boldsymbol{\nabla} P - \boldsymbol{\nabla}\Phi, \tag{2}$$

$$\Delta\Phi = 4\pi G \Sigma \delta(z). \tag{3}$$

Here, $\Phi = \Phi_{\mathrm{bulb}} + \Phi_{\mathrm{disk}} + \Phi_{\mathrm{DH}} = \Phi_{\mathrm{bulb}} + \Phi_{\mathrm{sg}}$. Furthermore, Φ_{bulb} is such that it doesn't yield any contribution to the surface density, i.e. $\Delta\Phi_{\mathrm{bulb}} = 0$, nor the pressure field, hence $\Sigma = \Sigma_{\mathrm{disk}} + \Sigma_{\mathrm{DH}}$ and $P = P_{\mathrm{disk}} + P_{\mathrm{DH}}$. Letting $q = \Sigma_{\mathrm{disk}}/\Sigma$, we have

$$\Sigma = \Sigma_{\mathrm{disk}} + \Sigma_{\mathrm{DH}} = \Sigma_{\mathrm{disk}}\left(1 + \frac{\Sigma_{\mathrm{DH}}}{\Sigma_{\mathrm{disk}}}\right) = \frac{1}{q}\Sigma_{\mathrm{disk}}. \tag{4}$$

Suppose that we have a polytrope gas such that $P = \kappa\Sigma^{\Gamma}$ and let

$$\psi = \int \frac{\mathrm{d}P(\Sigma)}{\Sigma} \Leftrightarrow \boldsymbol{\nabla}\psi = \frac{\boldsymbol{\nabla} P}{\Sigma}. \tag{5}$$

Then

$$\psi = \frac{\kappa\Gamma}{\Gamma - 1}\Sigma^{\Gamma-1}. \tag{6}$$

Letting $\Psi = \Phi + \psi$, we obtain

$$\frac{\partial \boldsymbol{v}}{\partial t} + (\boldsymbol{v} \cdot \boldsymbol{\nabla})(\boldsymbol{v}) = -\boldsymbol{\nabla}\Psi. \tag{7}$$

If $\Sigma_{\mathrm{disk}} \propto \Sigma_{\mathrm{DH}}$ then $q \in [0, 1]$ is constant and this system of equation can be rewritten as

$$\frac{\partial \Sigma_{\mathrm{disk}}}{\partial t} + \frac{1}{r}\frac{\partial (r\Sigma_{\mathrm{disk}} v_r)}{\partial r} + \frac{1}{r}\frac{\partial (\Sigma_{\mathrm{disk}} v_\theta)}{\partial \theta} = 0, \tag{8}$$

$$\frac{\partial v_r}{\partial t} + v_r\frac{\partial v_r}{\partial r} + \frac{v_\theta}{r}\frac{\partial v_r}{\partial \theta} - \frac{(v_\theta)^2}{r} = -\frac{\partial \Psi}{\partial r}, \tag{9}$$

$$\frac{\partial v_\theta}{\partial t} + v_r\frac{\partial v_\theta}{\partial r} + \frac{v_\theta}{r}\frac{\partial v_\theta}{\partial \theta} + \frac{v_r v_\theta}{r} = -\frac{1}{r}\frac{\partial \Psi}{\partial \theta}, \tag{10}$$

$$\Delta\Phi_{\mathrm{sg}} = 4\pi G\frac{1}{q}\Sigma_{\mathrm{disk}}\delta(z). \tag{11}$$

Let M be the total mass of the galactic disk+bulb. Let $\Phi_{\text{bulb}} = -GM(1-x)/\sqrt{c^2+r^2}$ with $x \in [0,1]$. An equilibrium state is given by the Plummer equilibrium, such that

$$v_r^0 = 0, \qquad (v_\theta^0)^2 = r\frac{\partial \Psi^0}{\partial r}, \tag{12}$$

$$\psi^0 = \frac{\kappa\Gamma}{\Gamma-1}(\Sigma^0)^{\Gamma-1} = \frac{\kappa\Gamma}{(\Gamma-1)q^{\Gamma-1}}(\Sigma_{\text{disk}}^0)^{\Gamma-1}, \tag{13}$$

$$\Sigma_{\text{disk}}^0 = \frac{xM}{2\pi a^2}\frac{1}{(1+(r/a)^2)^{3/2}}, \tag{14}$$

$$\Phi_{\text{sg}}^0 = -\frac{GMx}{a}\frac{1}{\sqrt{1+(r/a)^2}}. \tag{15}$$

Therefore, letting $\varepsilon = (3a\kappa\Gamma)/(GM)\cdot(M/(2\pi a^2))^{\Gamma-1}$ (CHECK THIS),

$$\Psi^0 = -\frac{GM(1-x)}{c}\frac{1}{\sqrt{1+(r/c)^2}} - \frac{GMx}{a}\frac{1}{\sqrt{1+(r/a)^2}} + \frac{\kappa\Gamma}{(\Gamma-1)q^{\Gamma-1}}(\Sigma_{\text{disk}}^0)^{\Gamma-1}, \tag{16}$$

$$= -\frac{GM}{c}\frac{1-x}{\sqrt{1+(r/c)^2}} + \frac{GM}{a}\left[-\frac{x}{\sqrt{1+(r/a)^2}} + \frac{\varepsilon}{3(\Gamma-1)q^{\Gamma-1}}\left(\frac{x}{(1+(r/a)^2)^{3/2}}\right)^{\Gamma-1}\right], \tag{17}$$

$$\tag{18}$$

The perturbative equation at 1st order are

$$\frac{\partial \Sigma_{\text{disk}}^p}{\partial t} + \frac{1}{r}\frac{\partial(r\Sigma_{\text{disk}}^0 v_r^p)}{\partial r} + \frac{\Sigma_{\text{disk}}^0}{r}\frac{\partial v_\theta^p}{\partial \theta} + \frac{v_\theta^0}{r}\frac{\partial \Sigma_{\text{disk}}^p}{\partial \theta} = 0, \tag{19}$$

$$\frac{\partial v_r^p}{\partial t} + \frac{v_\theta^0}{r}\frac{\partial v_r^p}{\partial \theta} - 2\frac{v_\theta^0 v_\theta^p}{r} = -\frac{\partial \Psi^p}{\partial r}, \tag{20}$$

$$\frac{\partial v_\theta^p}{\partial t} + v_r^p\frac{\partial v_\theta^0}{\partial r} + \frac{v_\theta^0}{r}\frac{\partial v_\theta^p}{\partial \theta} + \frac{v_r^p v_\theta^0}{r} = -\frac{1}{r}\frac{\partial \Psi^p}{\partial \theta}, \tag{21}$$

$$\Delta\Phi_{\text{sg}}^p = 4\pi G\frac{1}{q}\Sigma_{\text{disk}}^p\delta(z), \tag{22}$$

$$\psi^p = \frac{\kappa\Gamma}{q^{\Gamma-1}}(\Sigma_{\text{disk}}^0)^{\Gamma-2}\Sigma_{\text{disk}}^p, \tag{23}$$

$$\tag{24}$$

We define $X^p(r,\theta,t) = \sum_{m\in\mathbb{Z}} X_m^p(r,t)e^{im\theta}$ and look for a temporal dependency in $e^{-i\omega t}$. Aoki & Iye say that there is this following correspondance between surface density and gravitational potential through the Poisson equation:

$$(\Sigma_{\text{disk}})_m^p(r,\theta) = \frac{xM}{2\pi a^2}\frac{1}{(1+(r/a)^2)^{3/2}}\sum_{n=|m|}^{\infty} a_n^m \widehat{P_n^{|m|}}(\xi)e^{-i\omega t}, \tag{25}$$

$$(\Phi_{\text{sg}})_m^p(r,\theta) = -\frac{GMx}{aq}\frac{1}{\sqrt{1+(r/a)^2}}\sum_{n=|m|}^{\infty}\frac{a_n^m}{2n+1}\widehat{P_n^{|m|}}(\xi)e^{-i\omega t}, \tag{26}$$

$$\tag{27}$$

where $\xi = (r^2-a^2)/(r^2+a^2)$.
