1 Self-gravitating thin disk with constant total mass

1.1 General setting

Consider a self gravitating disk with surface density Σ and gravitational potential Φ. Let $\boldsymbol{v}$ be its velocity field and P its pression field. Then it is described by the system

$$\frac{\partial \Sigma}{\partial t} + \boldsymbol{\nabla} \cdot (\Sigma \boldsymbol{v}) = 0, \tag{1}$$

$$\frac{\partial \boldsymbol{v}}{\partial t} + (\boldsymbol{v} \cdot \boldsymbol{\nabla})(\boldsymbol{v}) = -\frac{1}{\Sigma}\boldsymbol{\nabla} P - \boldsymbol{\nabla}\Phi, \tag{2}$$

$$\Delta\Phi = 4\pi G \Sigma \delta(z). \tag{3}$$

Here, $\Phi = \Phi_{\text{bulb}} + \Phi_{\text{disk}} + \Phi_{\text{DH}} = \Phi_{\text{bulb}} + \Phi_{\text{sg}}$. Furthermore, Φ_{bulb} is such that it doesn't yield any contribution to the surface density, i.e. $\Delta\Phi_{\text{bulb}} = 0$, nor the pressure field, hence $\Sigma = \Sigma_{\text{disk}} + \Sigma_{\text{DH}}$ and $P = P_{\text{disk}} + P_{\text{DH}}$. Letting $q = \Sigma/\Sigma_{\text{disk}}$, we have

$$\Sigma = \Sigma_{\text{disk}} + \Sigma_{\text{DH}} = \Sigma_{\text{disk}}\left(1 + \frac{\Sigma_{\text{DH}}}{\Sigma_{\text{disk}}}\right) = q\Sigma_{\text{disk}}. \tag{4}$$

Suppose that we have a polytrope gas such that $P = \kappa\Sigma^{\Gamma}$ and let

$$\psi = \int \frac{\mathrm{d}P(\Sigma)}{\Sigma} \Leftrightarrow \boldsymbol{\nabla}\psi = \frac{\boldsymbol{\nabla} P}{\Sigma}. \tag{5}$$

Then

$$\psi = \frac{\kappa\Gamma}{\Gamma - 1}\Sigma^{\Gamma-1}. \tag{6}$$

Letting $\Psi = \Phi + \psi$, we obtain

$$\frac{\partial \boldsymbol{v}}{\partial t} + (\boldsymbol{v} \cdot \boldsymbol{\nabla})(\boldsymbol{v}) = -\boldsymbol{\nabla}\Psi. \tag{7}$$

If $\Sigma_{\text{disk}} \propto \Sigma_{\text{DH}}$ then $q \in [1, +\infty[$ is constant and $q = 1 + M_{\text{DH}}/M_{\text{disk}}$. Let M be the total mass of the galactic disk+bulb+DH. Let $x = M_{\text{disk}}/M$. Then

$$
\begin{aligned}
M_{\rm disk} &= xM,\\
M_{\rm DH} &= (q-1)xM,\\
M_{\rm bulb} &= (1-qx)M.
\end{aligned}
$$

where $qx = (1 + M_{\rm DH}/M_{\rm disk})(M_{\rm disk}/M) = (M_{\rm disk} + M_{\rm DH})/M < 1$. Therefore from the mass fractions we can obtain x and q by taking

$$
\begin{aligned}
x &= \frac{M_{\rm disk}}{M},\\
q &= 1 + \frac{M_{\rm DH}/M}{M_{\rm disk}/M}.
\end{aligned}
$$

The system of equation can be rewritten as

$$
\frac{\partial \Sigma_{\rm disk}}{\partial t} + \frac{1}{r}\frac{\partial (r\Sigma_{\rm disk} v_r)}{\partial r} + \frac{1}{r}\frac{\partial (\Sigma_{\rm disk} v_\theta)}{\partial \theta} = 0, \tag{8}
$$

$$
\frac{\partial v_r}{\partial t} + v_r \frac{\partial v_r}{\partial r} + \frac{v_\theta}{r}\frac{\partial v_r}{\partial \theta} - \frac{(v_\theta)^2}{r} = -\frac{\partial \Psi}{\partial r}, \tag{9}
$$

$$
\frac{\partial v_\theta}{\partial t} + v_r \frac{\partial v_\theta}{\partial r} + \frac{v_\theta}{r}\frac{\partial v_\theta}{\partial \theta} + \frac{v_r v_\theta}{r} = -\frac{1}{r}\frac{\partial \Psi}{\partial \theta}, \tag{10}
$$

$$
\Delta \Phi_{\rm sg} = 4\pi G q \Sigma_{\rm disk} \delta(z). \tag{11}
$$

Let $\Phi_{\rm bulb} = -GM(1-qx)/\sqrt{c^2+r^2}$ with $x \in [0,1]$. An equilibrium state is given by the Plummer equilibrium, such that, letting $\xi = (r^2-a^2)/(r^2+a^2)$, that is, $r/a = \sqrt{(1+\xi)/(1-\xi)}$,

$$
\begin{aligned}
v_r^0 &= 0, \qquad (v_\theta^0)^2 = r\frac{\partial \Psi^0}{\partial r},\\
\psi^0 &= \frac{\kappa\Gamma}{\Gamma-1}(\Sigma^0)^{\Gamma-1} = \frac{\kappa\Gamma q^{\Gamma-1}}{(\Gamma-1)}(\Sigma^0_{\rm disk})^{\Gamma-1},\\
\Sigma^0_{\rm disk} &= \frac{xM}{2\pi a^2}\frac{1}{(1+(r/a)^2)^{3/2}} = \frac{xM}{2\pi a^2}\left(\frac{1-\xi}{2}\right)^{3/2},\\
\Phi^0_{\rm sg} &= -\frac{GMqx}{a}\frac{1}{\sqrt{1+(r/a)^2}} = -\frac{GMqx}{a}\left(\frac{1-\xi}{2}\right)^{1/2}.
\end{aligned}
$$

Therefore, letting

$$
\varepsilon = \frac{U(x=1,q=1)}{|E(x=1,q=1)|} = \frac{3a\kappa\Gamma}{GM}\left(\frac{M}{2\pi a^2}\right)^{\Gamma-1},
$$

we obtain

$$
\begin{aligned}
\Psi^0 &= -\frac{GM(1-qx)}{\sqrt{c^2+r^2}} - \frac{GMqx}{a}\left(\frac{1-\xi}{2}\right)^{1/2} + \frac{\kappa\Gamma}{(\Gamma-1)}(q\Sigma^0_{\rm disk})^{\Gamma-1},\\
&= -\frac{GM(1-qx)}{\sqrt{c^2+r^2}} + \frac{GM}{a}\left[-(qx)\left(\frac{1-\xi}{2}\right)^{1/2} + \frac{\varepsilon(qx)^{\Gamma-1}}{3(\Gamma-1)}\left(\frac{1-\xi}{2}\right)^{3(\Gamma-1)/2}\right],\\
&= \frac{GMqx}{a}\left[-\frac{a}{c}\frac{1-qx}{qx}\frac{1}{\sqrt{1+(r/c)^2}} - \left(\frac{1-\xi}{2}\right)^{1/2} + \frac{\varepsilon(xq)^{\Gamma-2}}{3(\Gamma-1)}\left(\frac{1-\xi}{2}\right)^{3(\Gamma-1)/2}\right],\\
(v_\theta^0)^2 &= r\frac{\partial\Psi^0}{\partial r} = r\frac{\partial\Psi^0}{\partial\xi}\frac{\partial\xi}{\partial r} = 4\left(\frac{r}{a}\right)^2\left(\frac{1-\xi}{2}\right)^2\frac{\partial\Psi^0}{\partial\xi} = (1+\xi)(1-\xi)\frac{\partial\Psi^0}{\partial\xi},\\
&= \frac{GM}{a}\left[\frac{a(1-qx)}{c}\left(\frac{r}{c}\right)^2\left(\frac{1}{1+(r/c)^2}\right)^{3/2} + qx\left(\frac{1+\xi}{2}\right)\left(\frac{1-\xi}{2}\right)^{1/2}\left(1-\varepsilon(qx)^{\Gamma-2}\left(\frac{1-\xi}{2}\right)^{\frac{3\Gamma}{2}-2}\right)\right],\\
&= \frac{GMqx}{a}\left[\frac{a}{c}\frac{1-qx}{qx}\left(\frac{r}{c}\right)^2\left(\frac{1}{1+(r/c)^2}\right)^{3/2} + \left(\frac{1+\xi}{2}\right)\left(\frac{1-\xi}{2}\right)^{1/2}\left(1-\varepsilon(qx)^{\Gamma-2}\left(\frac{1-\xi}{2}\right)^{\frac{3\Gamma}{2}-2}\right)\right],
\end{aligned}
$$

with

$$\frac{1-\xi}{2}=\frac{a^2}{r^2+a^2}=\frac{1}{1+(r/a)^2};\quad \frac{1+\xi}{2}=\frac{r^2}{r^2+a^2}=\frac{(r/a)^2}{1+(r/a)^2}.$$

Note that for $x=1$ (only disk) and $q=1$ (purely self-gravitating system), we recover the expression of Toomre

$$v_\theta^0=\left(\frac{GM}{a}\right)^{1/2}\left(\frac{1+\xi}{2}\right)^{1/2}\left(\frac{1-\xi}{2}\right)^{1/4}\sqrt{1-\varepsilon\left(\frac{1-\xi}{2}\right)^{\frac{3\Gamma}{2}-2}}.$$

The perturbative equation at 1st order are

$$\begin{aligned}
&\frac{\partial v_r^p}{\partial t}+\frac{v_\theta^0}{r}\frac{\partial v_r^p}{\partial\theta}-2\frac{v_\theta^0 v_\theta^p}{r}=-\frac{\partial\Psi^p}{\partial r},\\
&\frac{\partial v_\theta^p}{\partial t}+v_r^p\frac{\partial v_\theta^0}{\partial r}+\frac{v_\theta^0}{r}\frac{\partial v_\theta^p}{\partial\theta}+\frac{v_r^p v_\theta^0}{r}=-\frac{1}{r}\frac{\partial\Psi^p}{\partial\theta},\\
&\Delta\Phi_{\rm sg}^p=4\pi Gq\Sigma_{\rm disk}^p\delta(z),\\
&\psi^p=\kappa\Gamma q^{\Gamma-1}(\Sigma_{\rm disk}^0)^{\Gamma-2}\Sigma_{\rm disk}^p.
\end{aligned}$$

We define $X^p(r,\theta,t)=\sum_{m\in\mathbb{Z}}X_m^p(r,t)e^{im\theta}$ and look for a temporal dependency in $e^{-i\omega t}$. Aoki & Iye say that there is this following correspondance between surface density and gravitational potential through the Poisson equation:

$$(\Sigma_{\rm disk})_m^p(r,\theta)=\frac{xM}{2\pi a^2}\left(\frac{1-\xi}{2}\right)^{3/2}\sum_{n=|m|}^{\infty}a_n^m\widehat{P_n^{|m|}}(\xi)e^{-i\omega t},\tag{12}$$

$$(\Phi_{\rm sg})_m^p(r,\theta)=-\frac{GMqx}{a}\left(\frac{1-\xi}{2}\right)^{1/2}\sum_{n=|m|}^{\infty}\frac{a_n^m}{2n+1}\widehat{P_n^{|m|}}(\xi)e^{-i\omega t},\tag{13}$$

$$(\psi)_m^p(r,\theta)=\kappa\Gamma\left(\frac{M}{2\pi a^2}\right)^{\Gamma-1}(qx)^{\Gamma-1}\left(\frac{1-\xi}{2}\right)^{3/2(\Gamma-1)}\sum_{n=|m|}^{\infty}a_n^m\widehat{P_n^{|m|}}(\xi)e^{-i\omega t},\tag{14}$$

$$(\Psi)_m^p(r,\theta)=\frac{GMqx}{a}\left(\frac{1-\xi}{2}\right)^{1/2}\sum_{n=|m|}^{\infty}\left[\frac{\varepsilon}{3}(qx)^{\Gamma-2}\left(\frac{1-\xi}{2}\right)^{\frac{3\Gamma}{2}-2}-\frac{1}{2n+1}\right]a_n^m\widehat{P_n^{|m|}}(\xi)e^{-i\omega t}.\tag{15}$$

Let us decompose the velocity components based on their equilibrium expression:

$$(v_r)_m^p=i\frac{m}{|m|}\left(\frac{GMqx}{a}\right)^{1/2}\left(\frac{1+\xi}{2}\right)^{-1/2}\left(\frac{1-\xi}{2}\right)^{1/4}\sum_{n=|m|}^{\infty}b_n^m\widehat{P_n^{|m|}}(\xi)e^{-i\omega t},\tag{16}$$

$$(v_\theta)_m^p=\left(\frac{GMqx}{a}\right)^{1/2}\left(\frac{1+\xi}{2}\right)^{-1/2}\left(\frac{1-\xi}{2}\right)^{1/4}\sum_{n=|m|}^{\infty}c_n^m\widehat{P_n^{|m|}}(\xi)e^{-i\omega t}.\tag{17}$$

Letting $X_m^p=X^1e^{-i\omega t}$, this yields the set of equations

$$i(-\omega+m\Omega)(\Sigma_{\rm disk})^1+\frac{1}{r}\frac{\mathrm{d}(r\Sigma_0(v_r)^1)}{\mathrm{d}r}+\frac{im\Sigma^0(v_\theta)^1}{r}=0,\tag{18}$$

$$\frac{\mathrm{d}(\Psi)^1}{\mathrm{d}r}+i(-\omega+m\Omega)(v_r)^1-2\Omega(v_\theta)^1=0,\tag{19}$$

$$im\frac{(\Psi)^1}{r}+\frac{\alpha^2}{2\Omega}(v_r)^1+i(-\omega+m\Omega)(v_\theta)^1=0,\tag{20}$$

where $\Omega = v_\theta^0/r$ is the angular velocity and $\alpha^2 = 4\Omega^2[1 + r/(2\Omega)\cdot(\mathrm{d}\Omega/\mathrm{d}r)]$ is the epicyclic frequency. Using the relation

$$\int_{-1}^{1} \mathrm{d}\xi \widehat{P_n^{|m|}}(\xi)\widehat{P_l^{|m|}}(\xi) = \delta_{nl},$$

and defining $\Omega_{\mathrm{ref}} = (GMqx/(a^3))^{1/2}$, $\Sigma_{\mathrm{ref}} = xM/(2\pi a^2)$ such that $\widehat{\omega} = \omega/\Omega_{\mathrm{ref}}$, $\widehat{\Omega} = \Omega/\Omega_{\mathrm{ref}}$, $\widehat{\alpha} = \alpha/\Omega_{\mathrm{ref}}$, $\widehat{\Sigma} = \Sigma/\Sigma_{\mathrm{ref}}$ and $\lambda = \frac{|m|}{m}\widehat{\omega}$, we obtain the matrix equations

$$\begin{aligned}
\sum_{n=|m|}^{\infty} A_{ln}a_n^m + \sum_{n=|m|}^{\infty} B_{ln}b_n^m + \sum_{n=|m|}^{\infty} C_{ln}c_n^m &= \lambda a_l^m,\\
\sum_{n=|m|}^{\infty} D_{ln}a_n^m + \sum_{n=|m|}^{\infty} A_{ln}b_n^m + \sum_{n=|m|}^{\infty} F_{ln}c_n^m &= \lambda b_l^m,\\
\sum_{n=|m|}^{\infty} G_{ln}a_n^m + \sum_{n=|m|}^{\infty} H_{ln}b_n^m + \sum_{n=|m|}^{\infty} A_{ln}c_n^m &= \lambda b_l^m,
\end{aligned}$$

where we defined

$$\begin{aligned}
A_{ln} &= |m|\int_{-1}^{1} \mathrm{d}\xi \widehat{P_l^{|m|}}(\xi)\widehat{\Omega}(\xi)\widehat{P_n^{|m|}}(\xi),\\
B_{ln} &= 4\int_{-1}^{1} \mathrm{d}\xi \widehat{P_l^{|m|}}(\xi)\left(\frac{1-\xi}{2}\right)^{1/2}\frac{\mathrm{d}}{\mathrm{d}\xi}\left[\left(\frac{1-\xi}{2}\right)^{5/4}\widehat{P_n^{|m|}}(\xi)\right],\\
C_{ln} &= |m|\int_{-1}^{1} \mathrm{d}\xi \widehat{P_l^{|m|}}(\xi)\left(\frac{1-\xi}{2}\right)^{3/4}\left(\frac{1+\xi}{2}\right)^{-1}\widehat{P_n^{|m|}}(\xi),\\
D_{ln} &= 4\int_{-1}^{1} \mathrm{d}\xi \widehat{P_l^{|m|}}(\xi)\left(\frac{1-\xi}{2}\right)^{5/4}\left(\frac{1+\xi}{2}\right)\frac{\mathrm{d}}{\mathrm{d}\xi}\left[\left(\frac{1}{2n+1} - \frac{\varepsilon}{3}(qx)^{\Gamma-2}\left(\frac{1-\xi}{2}\right)^{\frac{3\Gamma}{2}-2}\right)\left(\frac{1-\xi}{2}\right)^{1/2}\widehat{P_n^{|m|}}(\xi)\right],\\
F_{ln} &= 2\int_{-1}^{1} \mathrm{d}\xi \widehat{P_l^{|m|}}(\xi)\widehat{\Omega}(\xi)\widehat{P_n^{|m|}}(\xi),\\
G_{ln} &= -|m|\int_{-1}^{1} \mathrm{d}\xi \widehat{P_l^{|m|}}(\xi)\left(\frac{1-\xi}{2}\right)^{3/4}\left(\frac{1}{2n+1} - \frac{\varepsilon}{3}(qx)^{\Gamma-2}\left(\frac{1-\xi}{2}\right)^{\frac{3\Gamma}{2}-2}\right)\widehat{P_n^{|m|}}(\xi),\\
H_{ln} &= \int_{-1}^{1} \mathrm{d}\xi \widehat{P_l^{|m|}}(\xi)\frac{\widehat{\alpha}^2(\xi)}{2\widehat{\Omega}(\xi)}\widehat{P_n^{|m|}}(\xi).
\end{aligned}$$

with

$$\begin{aligned}
\widehat{\Omega}(\xi) &= \sqrt{\frac{1-\xi}{1+\xi}}\sqrt{\frac{a}{c}\frac{1-qx}{qx}\left(\frac{r}{c}\right)^2\left(\frac{1}{1+(r/c)^2}\right)^{3/2} + \left(\frac{1+\xi}{2}\right)\left(\frac{1-\xi}{2}\right)^{1/2}\left[1-\varepsilon(qx)^{\Gamma-2}\left(\frac{1-\xi}{2}\right)^{\frac{3\Gamma}{2}-2}\right]},\\
\frac{\widehat{\alpha}^2(\xi)}{2\widehat{\Omega}(\xi)} &= 2\widehat{\Omega}(\xi)\left[1 + \frac{r}{2\widehat{\Omega}}\frac{\mathrm{d}\widehat{\Omega}}{\mathrm{d}r}\right] = 2\widehat{\Omega}(\xi)\left[1 + \frac{(1+\xi)(1-\xi)}{2\widehat{\Omega}}\frac{\mathrm{d}\widehat{\Omega}}{\mathrm{d}\xi}\right],
\end{aligned}$$

where

$$\frac{\mathrm{d}(r/a)}{\mathrm{d}\xi} = \frac{\mathrm{d}}{\mathrm{d}\xi}\left[\sqrt{\frac{1+\xi}{1-\xi}}\right] = (1-\xi)^{-3/2}(1+\xi)^{-1/2}$$

Since $(r/c)^2 = (a/c)^2\cdot(r/a)^2 = (a/c)^2\cdot(1+\xi)/(1-\xi)$, we have that

$$\widehat{\Omega}(\xi) = \left(\frac{1-\xi}{2}\right)^{3/4}\sqrt{\left(\frac{a}{c}\right)^3\frac{1-qx}{qx}\left(\frac{1-\xi}{2}\right)^{-3/2}\left(\frac{1}{1+(r/c)^2}\right)^{3/2} + \left[1-\varepsilon(qx)^{\Gamma-2}\left(\frac{1-\xi}{2}\right)^{\frac{3\Gamma}{2}-2}\right]}.$$

1.2 Case $\Gamma = 4/3$

The expressions become

$$\widehat{\Omega}(\xi) = \left(\frac{1-\xi}{2}\right)^{3/4}\sqrt{\left(\frac{a}{c}\right)^3\frac{(1-qx)}{qx}\left(\frac{1-\xi}{2}\right)^{-3/2}\left(\frac{1}{1+(r/c)^2}\right)^{3/2}+\left[1-\varepsilon\left(\frac{1}{qx}\right)^{\frac{2}{3}}\right]},$$
$$\frac{\widehat{\alpha}^2(\xi)}{2\widehat{\Omega}(\xi)} = 2\widehat{\Omega}(\xi)\left[1+\frac{(1+\xi)(1-\xi)}{2\widehat{\Omega}}\frac{\mathrm{d}\widehat{\Omega}}{\mathrm{d}\xi}\right],$$

with the matrix elements

$$A_{ln} = |m|\int_{-1}^{1}\mathrm{d}\xi\widehat{P_l^{|m|}}(\xi)\widehat{\Omega}(\xi)\widehat{P_n^{|m|}}(\xi),$$
$$B_{ln} = 4\int_{-1}^{1}\mathrm{d}\xi\widehat{P_l^{|m|}}(\xi)\left(\frac{1-\xi}{2}\right)^{1/2}\frac{\mathrm{d}}{\mathrm{d}\xi}\left[\left(\frac{1-\xi}{2}\right)^{5/4}\widehat{P_n^{|m|}}(\xi)\right],$$
$$C_{ln} = |m|\int_{-1}^{1}\mathrm{d}\xi\widehat{P_l^{|m|}}(\xi)\left(\frac{1-\xi}{2}\right)^{3/4}\left(\frac{1+\xi}{2}\right)^{-1}\widehat{P_n^{|m|}}(\xi),$$
$$D_{ln} = 4\left(\frac{1}{2n+1}-\frac{\varepsilon}{3}\left(\frac{1}{qx}\right)^{\frac{2}{3}}\right)\int_{-1}^{1}\mathrm{d}\xi\widehat{P_l^{|m|}}(\xi)\left(\frac{1-\xi}{2}\right)^{5/4}\left(\frac{1+\xi}{2}\right)\frac{\mathrm{d}}{\mathrm{d}\xi}\left[\left(\frac{1-\xi}{2}\right)^{1/2}\widehat{P_n^{|m|}}(\xi)\right],$$
$$F_{ln} = 2\int_{-1}^{1}\mathrm{d}\xi\widehat{P_l^{|m|}}(\xi)\widehat{\Omega}(\xi)\widehat{P_n^{|m|}}(\xi),$$
$$G_{ln} = -|m|\left(\frac{1}{2n+1}-\frac{\varepsilon}{3}\left(\frac{1}{qx}\right)^{\frac{2}{3}}\right)\int_{-1}^{1}\mathrm{d}\xi\widehat{P_l^{|m|}}(\xi)\left(\frac{1-\xi}{2}\right)^{3/4}\widehat{P_n^{|m|}}(\xi),$$
$$H_{ln} = \int_{-1}^{1}\mathrm{d}\xi\widehat{P_l^{|m|}}(\xi)\frac{\widehat{\alpha}^2(\xi)}{2\widehat{\Omega}(\xi)}\widehat{P_n^{|m|}}(\xi).$$

Integrals A_{ln} and F_{ln} are proportional. With the addition of H_{ln}, those 3 integrals must be computed numerically because of the non-trivial shift in their expression induced by the bulb potential. As for B_{ln}, C_{ln}, D_{ln} and G_{ln}, their can be can expressed in terms of the two following integrals

$$\widehat{I}(l,n) = \int_{-1}^{1}\mathrm{d}\xi\left(\frac{1-\xi}{2}\right)^{3/4}\widehat{P_l^{|m|}}(\xi)\widehat{P_n^{|m|}}(\xi), \tag{21}$$
$$\widehat{J}(l,n) = \int_{-1}^{1}\mathrm{d}\xi\left(\frac{1-\xi}{2}\right)^{3/4}\left(\frac{1+\xi}{2}\right)^{-1}\widehat{P_l^{|m|}}(\xi)\widehat{P_n^{|m|}}(\xi), \tag{22}$$

as

$$B_{ln} = \frac{1}{2}\left[\sqrt{\frac{(2l+1)(l+m+1)(l-m+1)}{2l+3}}\widehat{J}(l+1,n)+\widehat{J}(l,n)\right.$$
$$\left.-\sqrt{\frac{(2l+1)(l+m)(l-m)}{2l-1}}\widehat{J}(l-1,n)\right],$$
$$C_{ln} = m\widehat{J}(l,n),$$
$$D_{ln} = \frac{1}{2}\left(\frac{1}{2n+1}-\frac{\varepsilon}{3}\left(\frac{1}{qx}\right)^{\frac{2}{3}}\right)\left[-\sqrt{\frac{(2n+1)(n+m+1)(n-m+1)}{2n+3}}\widehat{I}(l,n+1)\right.$$
$$-\widehat{I}(l,n)$$
$$\left.+\sqrt{\frac{(2n+1)(n+m)(n-m)}{2n-1}}\widehat{I}(l,n-1)\right],$$
$$G_{ln} = -|m|\left(\frac{1}{2n+1}-\frac{\varepsilon}{3}\left(\frac{1}{qx}\right)^{\frac{2}{3}}\right)\widehat{I}(l,n).$$

where $\widehat{I}(l,n)$ and $\widehat{J}(l,n)$ can be computed by recursion and using the symmetry $l \leftrightarrow n$. Defining

$$\widehat{I}'(l,n) = \int_{-1}^{1} \mathrm{d}\xi\, \xi \left(\frac{1-\xi}{2}\right)^{3/4} \widehat{P_l^{|m|}}(\xi)\widehat{P_n^{|m|}}(\xi), \tag{23}$$

$$\widehat{J}'(l,n) = \int_{-1}^{1} \mathrm{d}\xi\, \xi \left(\frac{1-\xi}{2}\right)^{3/4} \left(\frac{1+\xi}{2}\right)^{-1} \widehat{P_l^{|m|}}(\xi)\widehat{P_n^{|m|}}(\xi), \tag{24}$$

Starting from(Aoki79, A16)

$$\widehat{I}(l,n) = \sqrt{\frac{(2n+1)(2n-1)}{(n+m)(n-m)}}\widehat{I}'(l,n-1) - \sqrt{\frac{(n+m-1)(n-m-1)(2n+1)}{(n+m)(n-m)(2n-3)}}\widehat{I}(l,n-2),$$

$$\widehat{I}'(l,n-1) = \sqrt{\frac{(l+m+1)(l-m+1)}{(2l+1)(2l+3)}}\widehat{I}(l+1,n-1) + \sqrt{\frac{(l+m)(l-m)}{(2l+1)(2l-1)}}\widehat{I}(l-1,n-1),$$

hence to compute until $l,n = m+N$, we need to compute $\widehat{I}(l',m)$ until $l' = m+2N$. By convention (for the recursion), we have set $\widehat{I}(l',n') = 0$ for $l' < m$ or $n' < m$. We initialize with

$$\widehat{I}(l,m) = \frac{l-3/4-m-1}{l+3/4+m+1}\sqrt{\frac{(l+m)(2l+1)}{(l-m)(2l-1)}}\widehat{I}(l-1,m),$$

$$\widehat{I}(m,m) = 2^m \prod_{k=0}^{m} \frac{2k+1}{3/4+m+1+k}.$$

We proceed as follows:
- Compute the line $n = m$: $\widehat{I}(m,m)$, $\widehat{I}(m+1,m)$, ... , $\widehat{I}(m+2N,m)$
- Complete the line $l = m$ by symmetry
- Compute the line $n = m+1$: $\widehat{I}(m+1,m+1)$, $\widehat{I}(m+2,m+1)$, ... , $\widehat{I}(m+2N-1,m+1)$
- Complete the line $l = m+1$ by symmetry
- Compute the line $n = m+2$: $\widehat{I}(m+2,m+2)$, $\widehat{I}(m+3,m+2)$, ... , $\widehat{I}(m+2N-2,m+2)$
- ...
- Compute the line $n = m+N-1$: $\widehat{I}(m+N-1,m+N-1)$, $\widehat{I}(m+N+1,m+N-1)$.
- Complete the line $l = m+N-1$ by symmetry
- Compute the line $n = m+N$: $\widehat{I}(m+N,m+N)$.

As for $\widehat{J}$, let

$$\widehat{I}_\alpha(l,m) = \frac{(-1)^{l-m}(2m-1)!!2^{m+1}\Gamma(\alpha+1)\Gamma(\alpha+m+1)(l+m)!}{\Gamma(\alpha+1-l+m)\Gamma(\alpha+m+l+2)(l-m)!} \tag{25}$$

with $\widehat{I}_{3/4}(l,m) = \widehat{I}(l,m)$. We can also compute it by recursion using the formulae

$$\widehat{J}(l,n) = \sqrt{\frac{(2n+1)(2n-1)}{(n+m)(n-m)}}\widehat{J}'(l,n-1) - \sqrt{\frac{(n+m-1)(n-m-1)(2n+1)}{(n+m)(n-m)(2n-3)}}\widehat{J}(l,n-2),$$

$$\widehat{J}'(l,n-1) = \sqrt{\frac{(l+m+1)(l-m+1)}{(2l+1)(2l+3)}}\widehat{J}(l+1,n-1) + \sqrt{\frac{(l+m)(l-m)}{(2l+1)(2l-1)}}\widehat{J}(l-1,n-1),$$

hence to compute until $l,n = m+N$, we need to compute $\widehat{I}(l',m)$ until $l' = m+2N$. By convention (for the recursion), we have set $\widehat{I}(l',n')=0$ for $l'<m$ or $n'<m$. We initialize with

$$
\begin{aligned}
\widehat{J}(l,m) &= \sqrt{\frac{(l-m)(l-m-1)(2l+1)}{(l+m)(l+m-1)(2l-3)}}\widehat{J}(l-2,m)+4\sqrt{\frac{(2m+1)(2l+1)(2l-1)}{2m(l+m)(l+m-1)}}\widehat{I}_{7/3}(l-1,m-1),\\
\widehat{J}(m,m) &= \frac{2^m}{m}\prod_{k=1}^{m}\frac{2k+1}{3/4+m+k},\\
\widehat{J}(m+1,m) &= -\frac{7}{4}\frac{2^m\sqrt{2m+3}}{m}\prod_{k=0}^{m}\frac{2k+1}{3/4+m+1+k} = -\frac{7\sqrt{2m+3}}{4(3/4+2m+1)}\widehat{J}(m,m).
\end{aligned}
$$

We can compute the $\widehat{I}_{7/4}$ part by recursion. Indeed,

$$\widehat{I}_\alpha(l,m) = \frac{l-\alpha-m-1}{l+\alpha+m+1}\sqrt{\frac{(l+m)(2l+1)}{(l-m)(2l-1)}}\widehat{I}_\alpha(l-1,m), \tag{26}$$

$$\widehat{I}_\alpha(m,m) = 2^m\prod_{k=0}^{m}\frac{2k+1}{\alpha+m+1+k}. \tag{27}$$

Hence, we need to compute beforehand the values $\widehat{I}_\alpha(l',m-1)$ for $l=m-1,...,m+2N-1$, and then apply the same process as for $\widehat{I}$.

As for the numerical integral, we use a simple midpoint rule with K points. Those integrals have the form

$$I_{ln} = \int_{-1}^{1}\mathrm{d}\xi\widehat{P_l^{|m|}}(\xi)\phi(\xi)\widehat{P_n^{|m|}}(\xi) \approx \frac{2}{K}\sum_{k=1}^{K}\widehat{P_l^{|m|}}(\xi_k)\phi(\xi_k)\widehat{P_n^{|m|}}(\xi_k),$$

where $\xi_k=-1+(2/K)(k-1/2)$. As we with to compute those elements for $m\le l,n\le m+N$, we have to compute the $\widehat{P_l^{|m|}}(\xi_k)$ for $n=m,...,m+N$ and $k=1,...,K$. To that end, We compute before hand a table of the values $\{\widehat{P_l^{|m|}}(\xi_k)\}_{(n,k)}$ and of the values $\{\phi(\xi_k)\}_k$. The Legendre associated functions can be efficiently computed by using the Julia library "SphericalHarmomics", in which we use the function "computePlmcostheta($\theta, l_{\max}, m$)" which compute $\widehat{P_l^{|m|}}(\cos(\theta))/\sqrt{\pi}$ for all $n=0,...,l_{\max}$ at a given m.

2 Self-gravitating thin disk with constant stellar total

2.1 General setting

Consider the same system with $q=1+M_{\mathrm{DH}}/M_{\mathrm{disk}}$. Let M be the total stellar mass of the galactic disk+bulb. Let $x=M_{\mathrm{disk}}/M$. Then

$$
\begin{aligned}
M_{\mathrm{disk}} &= xM,\\
M_{\mathrm{DH}} &= (q-1)xM,\\
M_{\mathrm{bulb}} &= (1-x)M.
\end{aligned}
$$

Therefore from the mass fractions we can obtain x and q by taking

$$
\begin{aligned}
x &= \frac{M_{\mathrm{disk}}}{M},\\
q &= 1+\frac{M_{\mathrm{DH}}/M}{M_{\mathrm{disk}}/M}.
\end{aligned}
$$

with in particular $M_{\mathrm{sg}}=M_{\mathrm{disk}}+M_{\mathrm{DH}}=qxM$.

Letting

$$\varepsilon = \frac{U(x=1,q=1)}{|E(x=1,q=1)|} = \frac{3a\kappa\Gamma}{GM}\left(\frac{M}{2\pi a^2}\right)^{\Gamma-1},$$

we obtain

$$\begin{aligned}
\Psi^0 &= -\frac{GM(1-x)}{\sqrt{c^2+r^2}} - \frac{GMqx}{a}\left(\frac{1-\xi}{2}\right)^{1/2} + \frac{\kappa\Gamma}{(\Gamma-1)}(q\Sigma^0_{\rm disk})^{\Gamma-1},\\
&= -\frac{GM(1-x)}{\sqrt{c^2+r^2}} + \frac{GM}{a}\left[-(qx)\left(\frac{1-\xi}{2}\right)^{1/2} + \frac{\varepsilon(qx)^{\Gamma-1}}{3(\Gamma-1)}\left(\frac{1-\xi}{2}\right)^{3(\Gamma-1)/2}\right],\\
&= \frac{GMqx}{a}\left[-\frac{a}{c}\frac{1-x}{qx}\frac{1}{\sqrt{1+(r/c)^2}} - \left(\frac{1-\xi}{2}\right)^{1/2} + \frac{\varepsilon(xq)^{\Gamma-2}}{3(\Gamma-1)}\left(\frac{1-\xi}{2}\right)^{3(\Gamma-1)/2}\right],\\
(v^0_\theta)^2 &= r\frac{\partial\Psi^0}{\partial r} = r\frac{\partial\Psi^0}{\partial\xi}\frac{\partial\xi}{\partial r} = 4\left(\frac{r}{a}\right)^2\left(\frac{1-\xi}{2}\right)^2\frac{\partial\Psi^0}{\partial\xi} = (1+\xi)(1-\xi)\frac{\partial\Psi^0}{\partial\xi},\\
&= \frac{GM}{a}\left[\frac{a(1-x)}{c}\left(\frac{r}{c}\right)^2\left(\frac{1}{1+(r/c)^2}\right)^{3/2} + qx\left(\frac{1+\xi}{2}\right)\left(\frac{1-\xi}{2}\right)^{1/2}\left(1-\varepsilon(qx)^{\Gamma-2}\left(\frac{1-\xi}{2}\right)^{\frac{3\Gamma}{2}-2}\right)\right],\\
&= \frac{GMqx}{a}\left[\frac{a}{c}\frac{1-x}{qx}\left(\frac{r}{c}\right)^2\left(\frac{1}{1+(r/c)^2}\right)^{3/2} + \left(\frac{1+\xi}{2}\right)\left(\frac{1-\xi}{2}\right)^{1/2}\left(1-\varepsilon(qx)^{\Gamma-2}\left(\frac{1-\xi}{2}\right)^{\frac{3\Gamma}{2}-2}\right)\right],
\end{aligned}$$

with

$$\frac{1-\xi}{2} = \frac{a^2}{r^2+a^2} = \frac{1}{1+(r/a)^2}; \quad \frac{1+\xi}{2} = \frac{r^2}{r^2+a^2} = \frac{(r/a)^2}{1+(r/a)^2}.$$

Note that for $x = 1$ (only disk) and $q = 1$ (purely self-gravitating system), we recover the expression of Toomre

$$v^0_\theta = \left(\frac{GM}{a}\right)^{1/2}\left(\frac{1+\xi}{2}\right)^{1/2}\left(\frac{1-\xi}{2}\right)^{1/4}\sqrt{1-\varepsilon\left(\frac{1-\xi}{2}\right)^{\frac{3\Gamma}{2}-2}}.$$

Defining $\Omega_{\rm ref} = (GMqx/(a^3))^{1/2}$, $\Sigma_{\rm ref} = xM/(2\pi a^2)$ such that $\widehat{\omega} = \omega/\Omega_{\rm ref}$, $\widehat{\Omega} = \Omega/\Omega_{\rm ref}$, $\widehat{\alpha} = \alpha/\Omega_{\rm ref}$, $\widehat{\Sigma} = \Sigma/\Sigma_{\rm ref}$ and $\lambda = \frac{|m|}{m}\widehat{\omega}$, we obtain the matrix equations

$$\begin{aligned}
\sum_{n=|m|}^{\infty} A_{ln}a^m_n + \sum_{n=|m|}^{\infty} B_{ln}b^m_n + \sum_{n=|m|}^{\infty} C_{ln}c^m_n &= \lambda a^m_l,\\
\sum_{n=|m|}^{\infty} D_{ln}a^m_n + \sum_{n=|m|}^{\infty} A_{ln}b^m_n + \sum_{n=|m|}^{\infty} F_{ln}c^m_n &= \lambda b^m_l,\\
\sum_{n=|m|}^{\infty} G_{ln}a^m_n + \sum_{n=|m|}^{\infty} H_{ln}b^m_n + \sum_{n=|m|}^{\infty} A_{ln}c^m_n &= \lambda b^m_l,
\end{aligned}$$

where we defined

$$
\begin{aligned}
A_{ln} &= |m| \int_{-1}^{1} \mathrm{d}\xi \widehat{P_l^{|m|}}(\xi) \widehat{\Omega}(\xi) \widehat{P_n^{|m|}}(\xi), \\
B_{ln} &= 4 \int_{-1}^{1} \mathrm{d}\xi \widehat{P_l^{|m|}}(\xi) \left(\frac{1-\xi}{2}\right)^{1/2} \frac{\mathrm{d}}{\mathrm{d}\xi}\left[\left(\frac{1-\xi}{2}\right)^{5/4} \widehat{P_n^{|m|}}(\xi)\right], \\
C_{ln} &= |m| \int_{-1}^{1} \mathrm{d}\xi \widehat{P_l^{|m|}}(\xi) \left(\frac{1-\xi}{2}\right)^{3/4} \left(\frac{1+\xi}{2}\right)^{-1} \widehat{P_n^{|m|}}(\xi), \\
D_{ln} &= 4 \int_{-1}^{1} \mathrm{d}\xi \widehat{P_l^{|m|}}(\xi) \left(\frac{1-\xi}{2}\right)^{5/4} \left(\frac{1+\xi}{2}\right) \frac{\mathrm{d}}{\mathrm{d}\xi}\left[\left(\frac{1}{2n+1} - \frac{\varepsilon}{3}(qx)^{\Gamma-2}\left(\frac{1-\xi}{2}\right)^{\frac{3\Gamma}{2}-2}\right)\left(\frac{1-\xi}{2}\right)^{1/2} \widehat{P_n^{|m|}}(\xi)\right], \\
F_{ln} &= 2 \int_{-1}^{1} \mathrm{d}\xi \widehat{P_l^{|m|}}(\xi) \widehat{\Omega}(\xi) \widehat{P_n^{|m|}}(\xi), \\
G_{ln} &= -|m| \int_{-1}^{1} \mathrm{d}\xi \widehat{P_l^{|m|}}(\xi) \left(\frac{1-\xi}{2}\right)^{3/4} \left(\frac{1}{2n+1} - \frac{\varepsilon}{3}(qx)^{\Gamma-2}\left(\frac{1-\xi}{2}\right)^{\frac{3\Gamma}{2}-2}\right) \widehat{P_n^{|m|}}(\xi), \\
H_{ln} &= \int_{-1}^{1} \mathrm{d}\xi \widehat{P_l^{|m|}}(\xi) \frac{\widehat{\alpha}^2(\xi)}{2\widehat{\Omega}(\xi)} \widehat{P_n^{|m|}}(\xi).
\end{aligned}
$$

with

$$
\begin{aligned}
\widehat{\Omega}(\xi) &= \sqrt{\frac{1-\xi}{1+\xi}} \sqrt{\frac{a}{c}\frac{1-x}{qx}\left(\frac{r}{c}\right)^2\left(\frac{1}{1+(r/c)^2}\right)^{3/2} + \left(\frac{1+\xi}{2}\right)\left(\frac{1-\xi}{2}\right)^{1/2}\left[1-\varepsilon(qx)^{\Gamma-2}\left(\frac{1-\xi}{2}\right)^{\frac{3\Gamma}{2}-2}\right]}, \\
\frac{\widehat{\alpha}^2(\xi)}{2\widehat{\Omega}(\xi)} &= 2\widehat{\Omega}(\xi)\left[1 + \frac{r}{2\widehat{\Omega}}\frac{\mathrm{d}\widehat{\Omega}}{\mathrm{d}r}\right] = 2\widehat{\Omega}(\xi)\left[1 + \frac{(1+\xi)(1-\xi)}{2\widehat{\Omega}}\frac{\mathrm{d}\widehat{\Omega}}{\mathrm{d}\xi}\right],
\end{aligned}
$$

where

$$
\frac{\mathrm{d}(r/a)}{\mathrm{d}\xi} = \frac{\mathrm{d}}{\mathrm{d}\xi}\left[\sqrt{\frac{1+\xi}{1-\xi}}\right] = (1-\xi)^{-3/2}(1+\xi)^{-1/2}
$$

Since $(r/c)^2 = (a/c)^2 \cdot (r/a)^2 = (a/c)^2 \cdot (1+\xi)/(1-\xi)$, we have that

$$
\widehat{\Omega}(\xi) = \left(\frac{1-\xi}{2}\right)^{3/4} \sqrt{\left(\frac{a}{c}\right)^3 \frac{1-x}{qx}\left(\frac{1-\xi}{2}\right)^{-3/2}\left(\frac{1}{1+(r/c)^2}\right)^{3/2} + \left[1-\varepsilon(qx)^{\Gamma-2}\left(\frac{1-\xi}{2}\right)^{\frac{3\Gamma}{2}-2}\right]}.
$$

2.2 Case $\Gamma = 4/3$

The expressions become

$$
\begin{aligned}
\widehat{\Omega}(\xi) &= \left(\frac{1-\xi}{2}\right)^{3/4} \sqrt{\left(\frac{a}{c}\right)^3 \frac{(1-x)}{qx}\left(\frac{1-\xi}{2}\right)^{-3/2}\left(\frac{1}{1+(r/c)^2}\right)^{3/2} + \left[1-\varepsilon\left(\frac{1}{qx}\right)^{\frac{2}{3}}\right]}, \\
\frac{\widehat{\alpha}^2(\xi)}{2\widehat{\Omega}(\xi)} &= 2\widehat{\Omega}(\xi)\left[1 + \frac{(1+\xi)(1-\xi)}{2\widehat{\Omega}}\frac{\mathrm{d}\widehat{\Omega}}{\mathrm{d}\xi}\right],
\end{aligned}
$$

with the matrix elements

$$
\begin{aligned}
A_{ln} &= |m|\int_{-1}^{1} \mathrm{d}\xi \widehat{P_l^{|m|}}(\xi)\widehat{\Omega}(\xi)\widehat{P_n^{|m|}}(\xi),\\
B_{ln} &= 4\int_{-1}^{1} \mathrm{d}\xi \widehat{P_l^{|m|}}(\xi)\Big(\frac{1-\xi}{2}\Big)^{1/2}\frac{\mathrm{d}}{\mathrm{d}\xi}\Big[\Big(\frac{1-\xi}{2}\Big)^{5/4}\widehat{P_n^{|m|}}(\xi)\Big],\\
C_{ln} &= |m|\int_{-1}^{1} \mathrm{d}\xi \widehat{P_l^{|m|}}(\xi)\Big(\frac{1-\xi}{2}\Big)^{3/4}\Big(\frac{1+\xi}{2}\Big)^{-1}\widehat{P_n^{|m|}}(\xi),\\
D_{ln} &= 4\Big(\frac{1}{2n+1}-\frac{\varepsilon}{3}\Big(\frac{1}{qx}\Big)^{\frac{2}{3}}\Big)\int_{-1}^{1} \mathrm{d}\xi \widehat{P_l^{|m|}}(\xi)\Big(\frac{1-\xi}{2}\Big)^{5/4}\Big(\frac{1+\xi}{2}\Big)\frac{\mathrm{d}}{\mathrm{d}\xi}\Big[\Big(\frac{1-\xi}{2}\Big)^{1/2}\widehat{P_n^{|m|}}(\xi)\Big],\\
F_{ln} &= 2\int_{-1}^{1} \mathrm{d}\xi \widehat{P_l^{|m|}}(\xi)\widehat{\Omega}(\xi)\widehat{P_n^{|m|}}(\xi),\\
G_{ln} &= -|m|\Big(\frac{1}{2n+1}-\frac{\varepsilon}{3}\Big(\frac{1}{qx}\Big)^{\frac{2}{3}}\Big)\int_{-1}^{1} \mathrm{d}\xi \widehat{P_l^{|m|}}(\xi)\Big(\frac{1-\xi}{2}\Big)^{3/4}\widehat{P_n^{|m|}}(\xi),\\
H_{ln} &= \int_{-1}^{1} \mathrm{d}\xi \widehat{P_l^{|m|}}(\xi)\frac{\widehat{\alpha}^2(\xi)}{2\widehat{\Omega}(\xi)}\widehat{P_n^{|m|}}(\xi).
\end{aligned}
$$

2.3 Case $x = 1$

The angular frequency simplifies to

$$
\begin{aligned}
\widehat{\Omega}(\xi) &= \Big(\frac{1-\xi}{2}\Big)^{3/4}\sqrt{1-\varepsilon/q^{2/3}},\\
\frac{\widehat{\alpha}^2(\xi)}{2\widehat{\Omega}(\xi)} &= 2\widehat{\Omega}(\xi)\Big[1+\frac{(1+\xi)(1-\xi)}{2\widehat{\Omega}}\frac{\mathrm{d}\widehat{\Omega}}{\mathrm{d}\xi}\Big],
\end{aligned}
$$

with the response matrix $M(x, q, \varepsilon)$ elements

$$
\begin{aligned}
A_{ln} &= |m|\int_{-1}^{1} \mathrm{d}\xi \widehat{P_l^{|m|}}(\xi)\widehat{\Omega}(\xi)\widehat{P_n^{|m|}}(\xi),\\
B_{ln} &= 4\int_{-1}^{1} \mathrm{d}\xi \widehat{P_l^{|m|}}(\xi)\Big(\frac{1-\xi}{2}\Big)^{1/2}\frac{\mathrm{d}}{\mathrm{d}\xi}\Big[\Big(\frac{1-\xi}{2}\Big)^{5/4}\widehat{P_n^{|m|}}(\xi)\Big],\\
C_{ln} &= |m|\int_{-1}^{1} \mathrm{d}\xi \widehat{P_l^{|m|}}(\xi)\Big(\frac{1-\xi}{2}\Big)^{3/4}\Big(\frac{1+\xi}{2}\Big)^{-1}\widehat{P_n^{|m|}}(\xi),\\
D_{ln} &= 4\Big(\frac{1}{2n+1}-\frac{\varepsilon/q^{2/3}}{3}\Big)\int_{-1}^{1} \mathrm{d}\xi \widehat{P_l^{|m|}}(\xi)\Big(\frac{1-\xi}{2}\Big)^{5/4}\Big(\frac{1+\xi}{2}\Big)\frac{\mathrm{d}}{\mathrm{d}\xi}\Big[\Big(\frac{1-\xi}{2}\Big)^{1/2}\widehat{P_n^{|m|}}(\xi)\Big],\\
F_{ln} &= 2\int_{-1}^{1} \mathrm{d}\xi \widehat{P_l^{|m|}}(\xi)\widehat{\Omega}(\xi)\widehat{P_n^{|m|}}(\xi),\\
G_{ln} &= -|m|\Big(\frac{1}{2n+1}-\frac{\varepsilon/q^{2/3}}{3}\Big)\int_{-1}^{1} \mathrm{d}\xi \widehat{P_l^{|m|}}(\xi)\Big(\frac{1-\xi}{2}\Big)^{3/4}\widehat{P_n^{|m|}}(\xi),\\
H_{ln} &= \int_{-1}^{1} \mathrm{d}\xi \widehat{P_l^{|m|}}(\xi)\frac{\widehat{\alpha}^2(\xi)}{2\widehat{\Omega}(\xi)}\widehat{P_n^{|m|}}(\xi).
\end{aligned}
$$

The total response matrix $M(1, q, \varepsilon)$ is equal to the total response matrix $M(1, 1, \varepsilon/q^{2/3})$. We know that the sg disk $(x = 1, q = 1)$ is completely stabilised (i.e. no physical eigenvalues is non-vanishing imaginary part) above a certain threshold $\varepsilon_0 \sim 0.5$. Therefore, for a disk with no bulb $(x = 1)$ but with a dark halo $(q > 1)$and with temperature ε, it is stable when $\varepsilon/q^{2/3} > \varepsilon_0$, hence below the threshold $q_0 = (\varepsilon/\varepsilon_0)^{3/2}$. On the other hand, increasing M_{DH} has the effect of increasing q, meaning that $\varepsilon/q^{2/3} \to 0$.
